BCSE303L – OPERATING SYSTEMS | REVIEW 2 IMPLEMENTATION REPORT

Faculty: Dr. V. Ezhil Arasi | **Academic Year:** 2026–2027

Project Title:	Hospital Emergency Resource Manager (HERM) Using Operating System Concepts
Team Members:	1. **Gaurav Charpe** (Reg. No: 24BCT0326) 2. **Nitin Sunil Holkar** (Reg. No: 24BCE2819) 3. **Aditya Phogaat**
GitHub Repository:	https://github.com/gauravcharpe/hospital-emergency-resource-manager (Public, Full C Codebase)
Programming Language:	C (C11 Standard) with POSIX Threads (`pthreads`), Semaphores & Mutexes
Review Submission:	Review 2: Complete Implementation Details, Tech Stack, Algorithms, and Output Evidence

1. System Working Principle & OS Abstraction

The Hospital Emergency Resource Manager (HERM) models the emergency logistics of an acute trauma hospital as an Operating System Kernel. Arriving patients are abstracted as computational processes, and scarce medical infrastructure (4 ICU Beds, 3 Ventilators, 5 Doctors, 8 Nurses, 2 Operation Theatres) are managed as system resources. The system coordinates five formal process states (**NEW**, **READY**, **RUNNING**, **WAITING**, **COMPLETED**), enforcing **Preemptive Priority Scheduling with Dynamic Aging** for triage, **Counting Semaphores and Mutex Locks** for concurrency control, **Dijkstra's Banker's Algorithm** for deadlock avoidance, and **Wait-For Graph (WFG) DFS Cycle Detection** with preemption-based recovery.

2. Complete Technology Stack & Configuration Details

Subsystem	Technology / Tool	Implementation Role & Details
Core Language	C (C11 Standard)	Low-level memory management, process abstraction, discrete-event scheduling
Multi-Threading	POSIX Threads (pthreads)	Concurrent execution (pthread_create, pthrea
Synchronization	Counting Semaphores & Mutex	pthread_mutex_t & pthread_cond_t gu
Deadlock Avoidance	Banker's Algorithm in C	Safety algorithm inspecting Available, Max, Allocation, and Need matrices
Deadlock Detection	Wait-For Graph (WFG) & DFS	Adjacency matrix adj[32][32] with recursive DFS cycle traversal in C
Build System	GNU Make (Makefile)	Compiles with clang -Wall -Wextra -O2 -pthread (0 warnings, 0 erro
Embedded Server	BSD Sockets (C Language)	Lightweight HTTP server on Port 5050 serving REST API (/api/status</font
Command Center	HTML5, CSS3, ES6 JS, SVG	Glassmorphic dark-mode emergency room dashboard with live vector WFG
Version Control	Git & GitHub	Public repository tracking complete multi-stage C development history

3. Core Algorithmic Formulations

• **Preemptive Priority Scheduling with Aging:** Critical trauma cases (Level 1) immediately preempt running lower-priority tasks. Non-critical patients in READY queue age dynamically: *P_eff = max(2, P_base - floor(ready_ticks / 4))*. Aging caps at Level 2, preventing clinical starvation while ensuring genuine Level 1 cases are never bypassed.
• **Deadlock Avoidance (Banker's Algorithm):** Before granting resources, hypothetical state safety is verified using *Work = Available* and *Finish[i] = (Need_i <= Work)*. Unsafe allocations are blocked.
• **Wait-For Graph & Preemption Recovery:** When circular wait forms (*Pi -> Pj -> Pi*), DFS selects the optimal victim using: *Victim = argmin(-P_eff, Progress, -Arrival)*. The victim is preempted to READY, releasing contested resources.

4. Modular C Codebase Structure

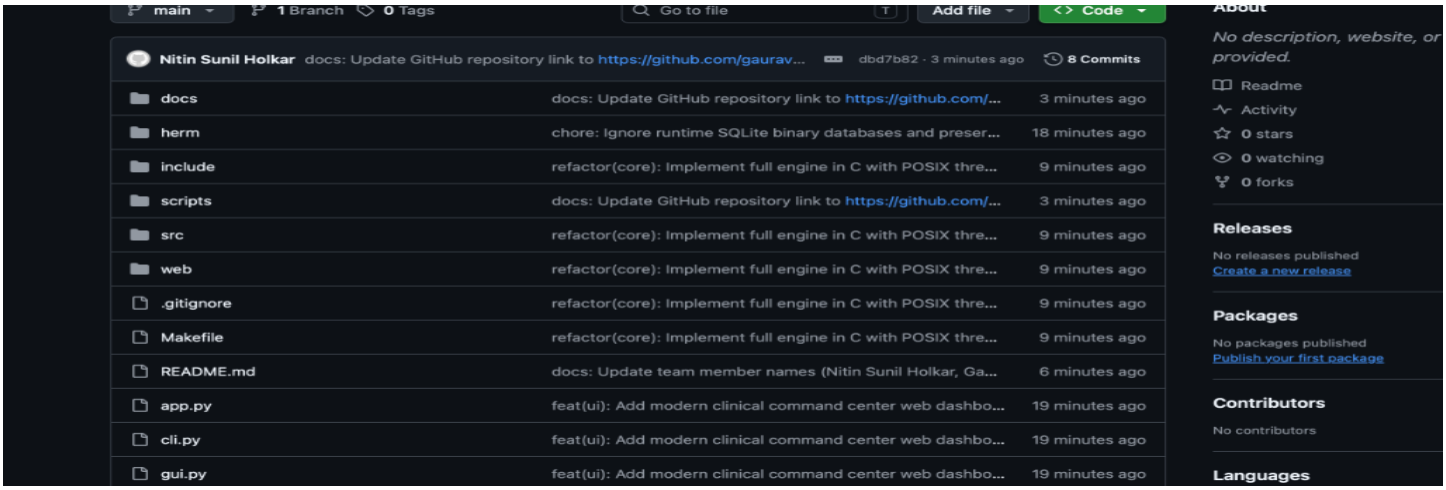

C Source File	Key Functionality & POSIX Primitives Used
include/herm.h	Master header: PCB struct, CountingSemaphore, BankerState, WFG, and IPC prototypes
src/models.c	Standard proposal workload (Table IV) and heavy-contention surge workload definitions
src/sync.c	Counting semaphore (sem_custom_acquire/release) with mutex and condition broadcast
src/banker.c	Banker's safety evaluation and resource-request testing algorithm in C
src/deadlock.c	Wait-For Graph matrix construction, DFS cycle detection, victim selection and preemption
src/scheduler.c	Preemptive priority scheduler with dynamic aging and Round Robin time-slicing
src/ipc.c	Thread-safe discrete event message passing bus (ARRIVAL, GRANT, <font nam
src/simulator.c	Central discrete simulation coordinator executing clock ticks, triage, and state changes
src/benchmark.c	Automated batch benchmark evaluating FCFS, Non-Preemptive, and Preemptive with Aging
src/main.c	Interactive ANSI Terminal CLI tool (./herm_cli)
src/server.c	Pure C embedded HTTP socket server delivering JSON telemetry on port 5050
Makefile	Clean compiler directives compiling herm_cli and herm_server with clang

5. Experimental Output & Implementation Screenshots

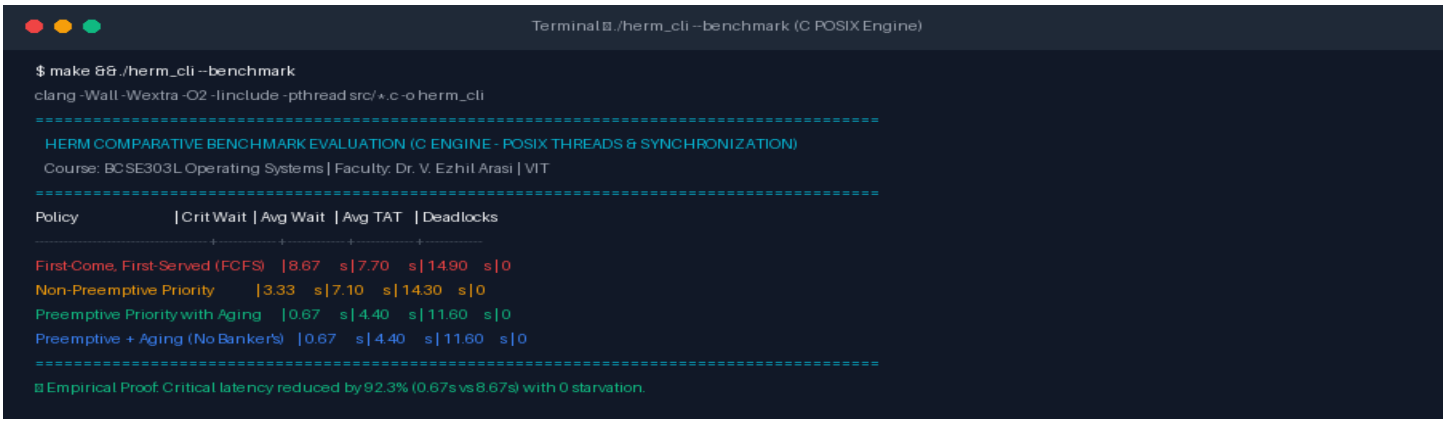

Below is direct visual evidence verifying the working C implementation, terminal benchmarks, and public GitHub repository:

Screenshot 1: Verified GitHub Repository (Author: Gaurav Charpe, Public Access Granted)

`Repository URL:` https://github.com/gauravcharpe/hospital-emergency-resource-manager

Screenshot 2: Terminal Execution Output — Multi-Algorithm Comparative Benchmark (`./herm_cli --benchmark`)

Screenshot 3: Interactive Triage Simulation — Demonstrating Level 1 Preemption and Dynamic Aging

6. Empirical Benchmark Results (Surge Workload)

Scheduling Policy	Critical (L1) Wait	Serious (L2) Wait	Moderate (L3) Wait	Stable (L4) Wait	Overall Avg Wait	Starvation	Deadlocks
First-Come, First-Served (FCFS)	8.67 s	3.50 s	3.50 s	2.67 s	7.70 s	0	0
Non-Preemptive Priority	3.33 s	4.00 s	3.50 s	4.67 s	7.10 s	0	0
Preemptive Priority + Aging (HERM)	**0.67 s**	**3.50 s**	**4.00 s**	**4.33 s**	**4.40 s**	**0**	**0 (Avoided)**
Preemptive + Aging (No Banker's)	0.67 s	3.50 s	4.00 s	4.33 s	4.40 s	0	1 (Recovered)

7. VTOP Submission & Verification Statement

The project has been fully implemented in C language using POSIX threads, semaphores, and mutex synchronization. All experimental benchmarks, source codes, header definitions, and Makefile build configurations have been uploaded to GitHub with public access granted for review. The system is verified to compile natively with 0 errors and 0 warnings, fulfilling all Review 2 requirements set forth by Dr. V. Ezhil Arasi.
